

Inspiring Excellence

Course Title: Programming Language II

Course Code: CSE 111 Lab Assignment no: 7

- ** You are not allowed to change any of the code of the tasks
- ** Use Inheritance to solve all problems

Given the following classes, write the code for the **BBA_Student** class so that the following output is printed:

```
Output:
class Student:
                                                      Name: default Department: BBA
    def init (self, name='Just a student',
                                                      Name: Humpty Dumpty
dept='nothing'):
                                                      Department: BBA
        self.__name = name
                                                      Name: Little Bo Peep
                                                      Department: BBA
        self. _department = dept
    def set_department(self, dept):
        self.__department = dept
    def get_name(self):
        return self.__name
    def set_name(self,name):
        self. name = name
    def str (self):
        return 'Name: '+self.__name+' Department:
'+self. department
#write your code here
print(BBA Student())
print(BBA_Student('Humpty Dumpty'))
```

<u>Task – 2</u>

```
class Vehicle:
                                                     OUTPUT:
                                                     Part 1
    def init (self):
        self.x = 0
                                                     (0, 0)
        self.y = 0
                                                     (0, 1)
    def moveUp(self):
                                                     (-1, 1)
        self.y+=1
                                                     (-1, 0)
    def moveDown(self):
                                                     (0, 0)
        self.y-=1
    def moveRight(self):
                                                     Part 2
        self.x+=1
    def moveLeft(self):
                                                     (0, 0)
                                                     (-1, -1)
        self.x-=1
                                                     False
    def __str__(self):
                                                     True
        return '('+str(self.x)+' , '+str(self.y)
+')'
#write your code here
print('Part 1')
print('----')
car = Vehicle()
print(car)
car.moveUp()
print(car)
car.moveLeft()
print(car)
car.moveDown()
print(car)
car.moveRight()
print(car)
print('----')
print('Part 2')
print('----')
car1 = Vehicle2010()
print(car1)
car1.moveLowerLeft()
print(car1)
car2 = Vehicle2010()
car2.moveLeft()
print(car1.equals(car2))
car2.moveDown()
print(car1.equals(car2))
```

A vehicle assumes that the whole world is a 2-dimensional graph paper. It maintains its

x and y coordinates (both are integers). The vehicle gets manufactured (constructed) at (0, 0) coordinate.

Subtasks:

- Design a Vehicle2010 class which inherits movement methods from Vehicle and adds new methods called move UpperRight, UpperLeft, LowerRight, LowerLeft. Each of these diagonal move methods must re-use two inherited and appropriate move methods.
- 2. Write an "equals" method which tests if significant class properties are the same (in this case x and y).

Note: All moves are 1 step. That means a single call to any move method changes value of either x or y or both by 1.

Task - 3

Given the following classes, write the code for the **Cricket_Tournament** and the **Tennis_Tournment** class so that the following output is printed.

```
class Tournament:
                                     OUTPUT:
                                     Cricket Tournament Name:
 _init__(self,name='Default'):
                                     Default Number of Teams: 0
       self. name = name
                                     Type: No type
    def set name(self,name):
       self. name = name
                                     Cricket Tournament Name: IPL
    def get name(self):
                                     Number of Teams: 10
       return self. name
                                     Type: t20
#write your code here
                                     Tennis Tournament Name: Roland
                                     Garros
ct1 = Cricket Tournament()
                                     Number of Players: 128
print(ct1.detail())
print("----")
Cricket Tournament("IPL",10,"t20")
print(ct2.detail())
print("----")
tt = Tennis Tournament("Roland
Garros",128)
```

Given the following classes, write the code for the **Book** and the **CD** class so that the following output is printed.

```
class Product:
                                            OUTPUT:
   def __init__(self,id, title, price):
                                            ID: 1 Title: The Alchemist
        self. id = id
                                            Price: 500 ISBN: 97806
        self. __title = title
                                            Publisher: HarperCollins
        self. price = price
    def get id title_price(self):
                                            ID: 2 Title: Shotto Price:
        return "ID: "+str(self. id)+"
                                            300
Title:"+self. title+
                           "Price:
                                            Band: Warfaze Duration:
"+str(self. price)
                                            50minutes Genre: Hard Rock
#write your code here
book = Book(1, "The
Alchemist",500,"97806","HarperCollins")
print(book.printDetail())
print("----")
cd = CD(2, "Shotto", 300, "Warfaze", 50, "Hard
Rock")
print(cd.printDetail())
```

Given the following classes, write the code for the **Dog** and the **Cat** class so that the following output is printed.

```
class Animal:
                                           OUTPUT:
                                           Animal does not make sound
    def __init__(self,sound):
        self.__sound = sound
                                           bark
    def makeSound(self):
        return self.__sound
class Printer:
    def printSound(self, a):
        print(a.makeSound())
#write your code here
d1 = Dog('bark')
c1 = Cat('meow')
a1 = Animal('Animal does not make
sound')
pr = Printer()
pr.printSound(a1)
pr.printSound(c1)
```

Given the following classes, write the code for the **Triangle** and the **Trapezoid** class so that the following output is printed.

```
class Shape:
                                             OUTPUT:
                                             Shape name: Default
                                             Height: 0, Base: 0
 def init (self, name='Default', height=0,
                                             Area: 0.0
base=0):
                                             _____
   self.area = 0
   self.name = name
                                             Shape name: Triangle
   self.height = height
                                             Height: 10, Base: 5
   self.base = base
                                             Area: 25.0
                                             _____
 def get height base(self):
   return "Height: "+str(self.height)+",Base:
                                             Shape name: Trapezoid
"+str(self.base)
                                             Height: 10, Base: 6,
                                             Side A: 4
#write your code here
                                             Area: 50.0
tri default = triangle()
tri default.calcArea()
print(tri default.printDetail())
print('----')
tri = triangle('Triangle', 10, 5)
tri.calcArea()
print(tri.printDetail())
print('----')
trap = trapezoid('Trapezoid', 10, 6, 4)
trap.calcArea()
print(trap.printDetail())
```

Given the following classes, write the code for the **Player** and the **Manager** class so that the following output is printed. To calculate the match earning use the following formula:

- 1. Player: (total_goal * 1000) + (total_match * 10)
- 2. Manager: match_win * 1000

```
class Football:
                                             OUTPUT:
                                             Name: Ronaldo, Team Name:
                                             Juventus
  def init (self, team name, name,
                                             Team Role: Striker
role):
                                             Total Goal: 25, Total
    self.__team = team_name
                                             Played: 32
    self. name = name
                                             Goal Ratio: 0.78125
    self.role = role
                                             Match Earning: 25320K
    self.earning per match = 0
  def get name team(self):
                                             Name: Zidane, Team Name:
    return 'Name: '+self. name+', Team
                                             Real Madrid
Name: ' +self. team
                                             Team Role: Manager
                                             Total Win: 25
#write your code here
                                             Match Earning: 25000K
player one = Player('Juventus', 'Ronaldo',
'Striker', 25, 32)
player one.calculate ratio()
player one.print details()
print('-----
----')
manager one = Manager('Real Madrid',
```
